## RIPARIAN TREE PLANTING

For any landowner with a stream running across their property, riparian buffers are highly recommended. Riparian buffers are wooded or grassed areas adjacent to streambanks, and there are numerous benefits - both environmental and economical - to planting them. Tree cover provides shade to lower water temperature which improves habitat for aquatic life, autumn leaf litter feeds aquatic bugs which increases the presence of fish, and roots absorb excess runoff. Trees also stabilize streambanks, so if you have problems with erosion, planting trees will help prevent the further loss of land and soil (and it is cheaper than putting in a stabilizing structure in the future). The buffer works both ways too – if you have problems with flooding from your stream, trees will act as a barrier to protect your fields. To see these benefits, riparian buffers should be at least 25 feet in width – more if a lot of water runs off from the field – but even having a single line of trees on the streambank is better than nothing. Pesticides, fertilizers and sediment have a much easier time entering our waterways if bare ground runs all the way up to the streambank.

With the upcoming tree sale, now is the perfect time to be thinking about a riparian forest buffer. The Soil and Water Conservation District offers many species of trees suitable for a riparian environment. When planting these buffers, it is important to remember how damp a tree likes its soil – some can tolerate the wet soils right up to the stream while others prefer the well-drained soils further back from the water. A few species to consider: Red Maple, River Birch and Swamp White Oak (all like wet soil); Ohio Buckeye, White Flowering Dogwood, Red Oak, Hackberry and Redbud (all like well-drained soil). Other trees to consider, not included in our sale, are Sweet Gum, Box Elder, Sycamore, Pin Oak, Northern Catalpa and Black Walnut. If you already have trees planted in your riparian zones, even better. These areas work best when trees are diverse in size and species. Smaller trees act as windbreaks, some may provide fruit for wildlife and grow quickly, while larger trees provide better canopy cover and take up more runoff. Having a variety of species can also mitigate the spread of disease or pests. Even scattering shrubs and tall grasses can be effective since they fill out open spaces and thicken the buffer (lawn grass being an exception since it does little to filter runoff). Not only do riparian zones offer conservation benefits, they enhance the visual appeal of your land too.

If you'd like to give your stream some tree cover, this newsletter contains a full list of species available for purchase. You can also call the SWCD for more information on which species are best for your stream and how and when to plant them.

Spring is almost here! It's time again for the Tree Seedling Sale. See inside for descriptions and order form.
